Description: A tablet computer, or simply tablet, is a portable device which can be operated via a touchscreen. There are many different versions available that differ according to size, or software. There are also special versions available designed in particular for older persons, which are easy to operate. Tablets basically have all the functions of regular computers: going online, use communication tools like E-Mail, reading books or playing games. Furthermore, new programs – apps – can be installed.

Case description: Mrs. Walker has no experience with computers so far but recently her grandson gave her a tablet computer as a present. The tablet was designed especially for older users. However, her grandson set it up so that Mrs. Walker can use it whenever she wants to. The tablet uses large fonts and buttons to start multiple applications, including games, communication apps and much more.
