

Robotic vacuum cleaner

Price: 100 EUR and more.

Where to buy: In every electronic store; on the Internet.

Description: A robotic vacuum cleaner automatically cleans your flat or house. There are many different types available that, more or less, work the same way but differ in terms of cleaning power or noise. The robots avoid obstacles autonomously. They can be operated via a smartphone, or programmed so that they start cleaning on schedule (e.g. when no one is at home). However, there are some limitations that need to be considered: Not all models work well on each surface and sometimes furniture has to be moved (e.g. if you want to clean between chairs). Therefore, it should be tested first. Furthermore, the robots can be a tripping hazard.

Case description: Mr. Kazim does not like vacuum cleaning. He bought a robotic vacuum cleaner for his flat so he does not need to worry about vacuum cleaning anymore. The programming and installation was a bit tricky that's why he asked one of his friends for help. Once everything has been set up, it works really well.
